
Operating System Concepts

**SunBeam Institute of
Information & Technology,
Hinjawadi, Pune & Karad.**

* **Introduction:**

- Why there is need of an OS?
- What is an OS?
- Booting process in brief
- Functions of an OS

* **UNIX System Architecture Design**

- Major subsystem of an UNIX system: File subsystem & Process Control subsystem.
- System Calls & its catagories
- Dual Mode Operation

* **Process Management**

- What is Process & PCB?
- States of the process
- CPU scheduling & CPU scheduling algorithms
- Inter Process Communication: Shared Memory Model & Message Passing Model

* **Process Management**

- Process Synchronization/Co-ordination
- Deadlocks & deadlock handling methods

* **Memory Management**

- Swapping
- Memory Allocation Methods
- Internal Fragmentation & External Fragmentation
- Segmentation
- Paging
- Virtual Memory Management

* **File Management**

- What is file?
- What is filesystem & filesystem structure?
- Disk space allocation methods
- Disk scheduling algorithms

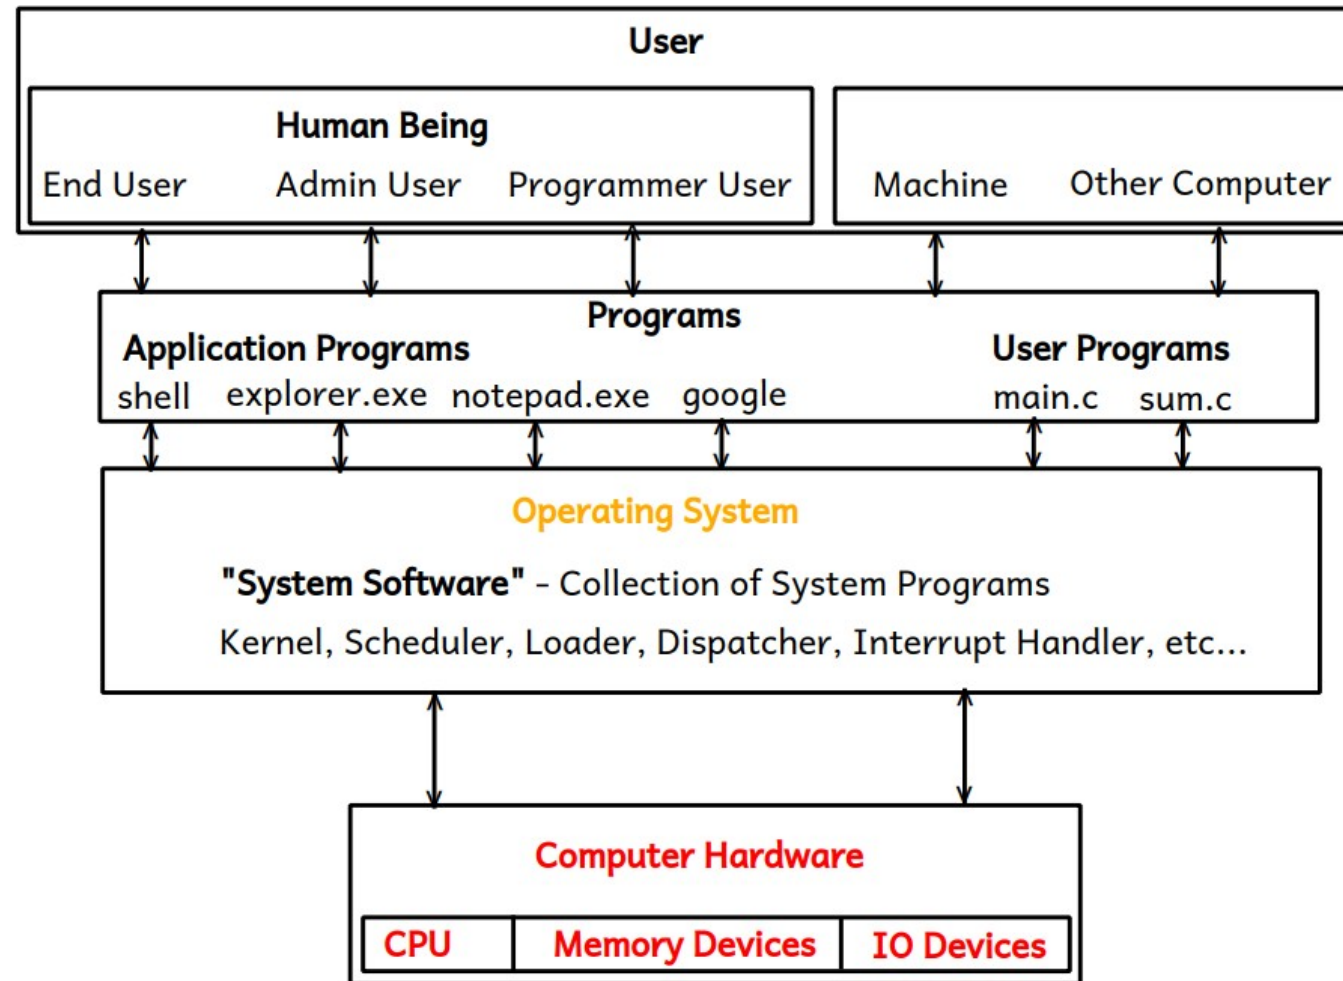

Q. Why there is a need of an OS?

- Computer is a machine/hardware does different tasks efficiently & accurately.
- Basic functions of computer:
 1. Data Storage
 2. Data Processing
 3. Data Movement
 4. Control
- As any user cannot communicates/interacts directly with computer hardware to do different tasks, and hence there is need of some interface between user and hardware.

Operating System Concepts

Operating System Concepts

Q. What is a Software?

- Software is a collection of programs.

Q. What is a Program?

- Program is a finite set of instructions written in any programming language (either low level or high level programming language) given to the machine to do specific task.

- Three types of programs are there:

1. "user programs": programs defined by the programmer user/developers

e.g. main.c, hello.java, addition.cpp etc....

2. "application programs": programs which comes with an OS/can be installed later

e.g. MS Office, Notepad, Compiler, IDE's, Google Chrome, Mozilla Firefox, Calculator, Games etc....

3. "System Programs": programs which are inbuilt in an OS/part of an OS.

e.g. Kernel, Loader, Scheduler, Memory Manager etc...

Operating System Concepts

Q. What is an IDE (Integrated Software Development) ?

- It is an application software i.e. collection of tools/programs like **source code editor, preprocessor, compiler, linker, debugger** etc... required for **faster software development**.

e.g. VS code editor, MS Visual Studio, Netbeans, Android Studio, Turbo C etc....

1. "Editor": it is an application program used for to write a source code.

e.g. notepad, vi editor, gedit etc...

2. "Preprocessor": it is an application program gets executes before compilation and does two jobs - it executes all preprocessor directives and removes all comments from the source code.

e.g. cpp

3. "Compiler": it is an application program which convert high level programming language code into low level programming language code i.e. human understandable language code into the machine understandable language code.

e.g. gcc, tc, visual c etc...

4. "Assembler": it is an application program which converts assembly language code into machine language code/object code.

e.g. masm, tasm etc...

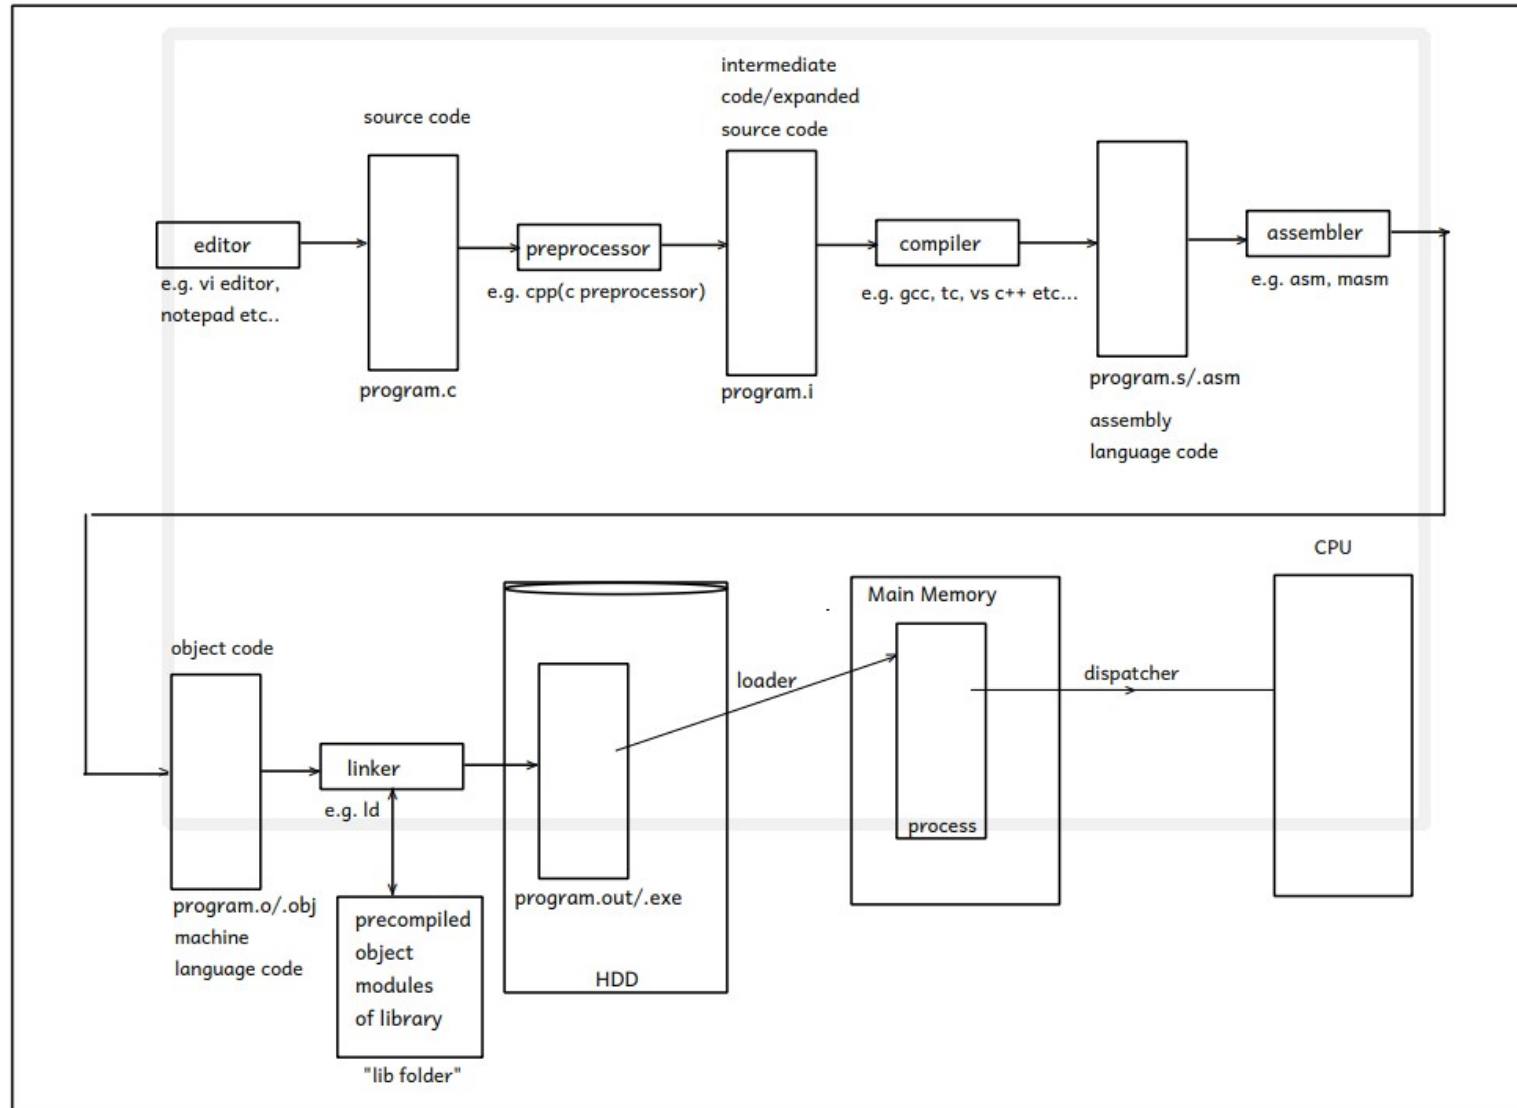

- Program written in any programming language is called as a "**source code**".

5. "Linker": it is an application program which links object file/s in a program with precompiled object modules of library functions exists in a lib folder and creates final single executable file.

e.g. ld: link editor in Linux.

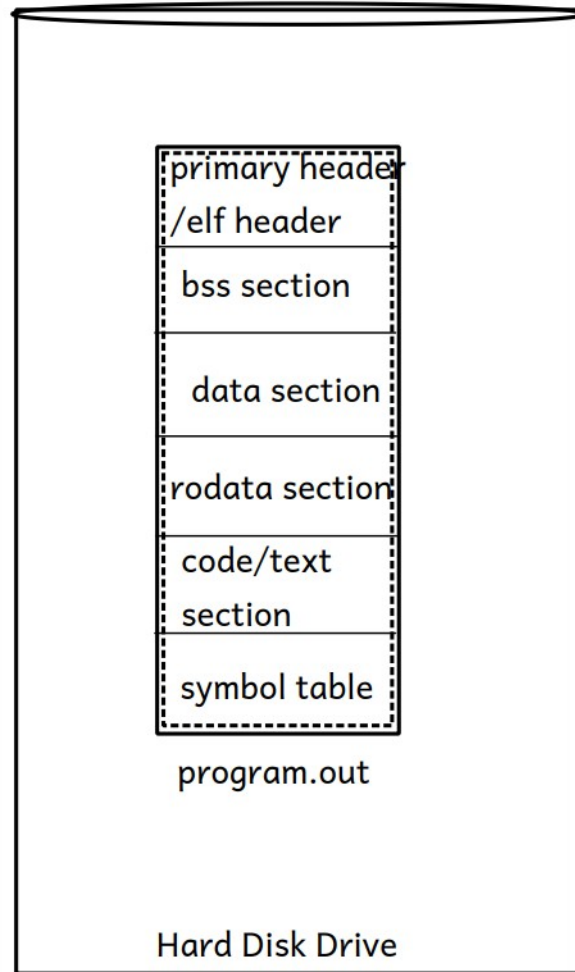

Operating System Concepts

Operating System Concepts

Structure of an executable file
ELF file format in Linux

1. primary header/exe header: it contains information which is required to start an execution of the program.

e.g. - addr of an entry point function --> main() function

- **magic number:** it is a constant number generated by the compiler which is file format specific.

- magic number in Linux starts with ELF in its eq **hexadecimal format**.

- info about remaining sections.

2. bss(block started by symbol) section: it contains uninitialized global & static vars

3. data section: it contains initialized global & static vars

4. rodata (readonly data) section: it contains string literals and constants.

5. code/text section: it contains executable instructions

6. symbol table: it contains info about functions and its vars in a tabular format.

Q. What is an Operating System?

- An OS is a **system software** (i.e. collection of system programs) which acts as an interface between user and hardware.
- An OS also acts as an interface between programs and hardware.
- An OS allocates resources like main memory, CPU time, i/o devices access etc... to all running programs, hence it is also called as a **resource allocator**.
- An OS controls an execution of all programs and it also controls hardware devices which are connected to the computer system and hence it is also called as a **control program**.

Q. What is an Operating System?

- An OS manages limited available resources among all running programs, hence it is also called as a **resource manager**.

- From End User: An OS is a software (i.e. collection of programs) comes either in CD/DVD, has following main components:

- 1. Kernel:** It is a core program/part of an OS which runs continuously into the main memory does basic minimal functionalities of it.

e.g. Linux: vmlinuz, Windows: ntoskrnl.exe

- 2. Utility Softwares:** e.g. disk manager, windows firewall, anti-virus software etc...

- 3. Application Softwares:** e.g. google chrome, shell, notepad, msoffice etc...

Functions of an OS:

Basic minimal functionalities/Kernel functionalities:

1. Process Management
2. Memory Management
3. Hardware Abstraction
4. CPU Scheduling
5. File & IO Management

Extra utility functionalities/optional:

6. Protection & Security
7. User Interfacing
8. Networking
